**Biomolecular Microengineering**

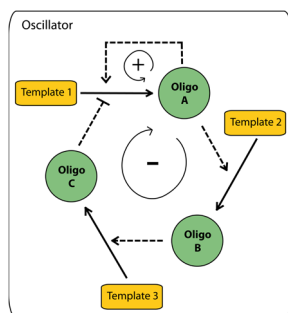

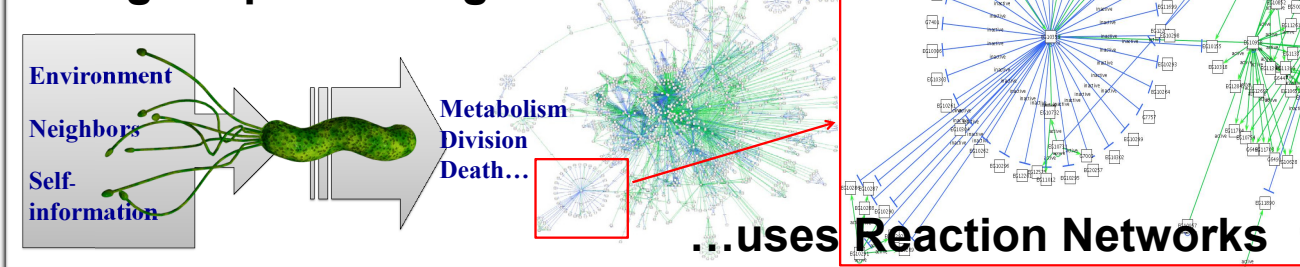

### Complex *in vitro* behaviors

Construction of Dynamic and Complex Functions by *in vitro* reaction network using biomolecules

Networks of interacting chemical reactions can lead to very complex behaviors, the ultimate example being life itself. For example, inside live cell Gene Networks can be arranged into switches, gates, memory element or oscillators. We want to build such dynamic systems, but in a artificial (*in vitro*) settings. To do this, we explore both homogeneous systems and more complex setups where diffusion and transport become key factors.

- DNA isothermal amplification reaction
- Molecular programming
- Chemical oscillations and multistability
- Molecular ecosystems
- Spatially distributed systems

### Biological processing of information...

Topology of a biochemical oscillator

Microfluidic network of reaction networks
