Theoretical Prediction of Strength and Physics of Nanomaterials and Multiscale Simulation

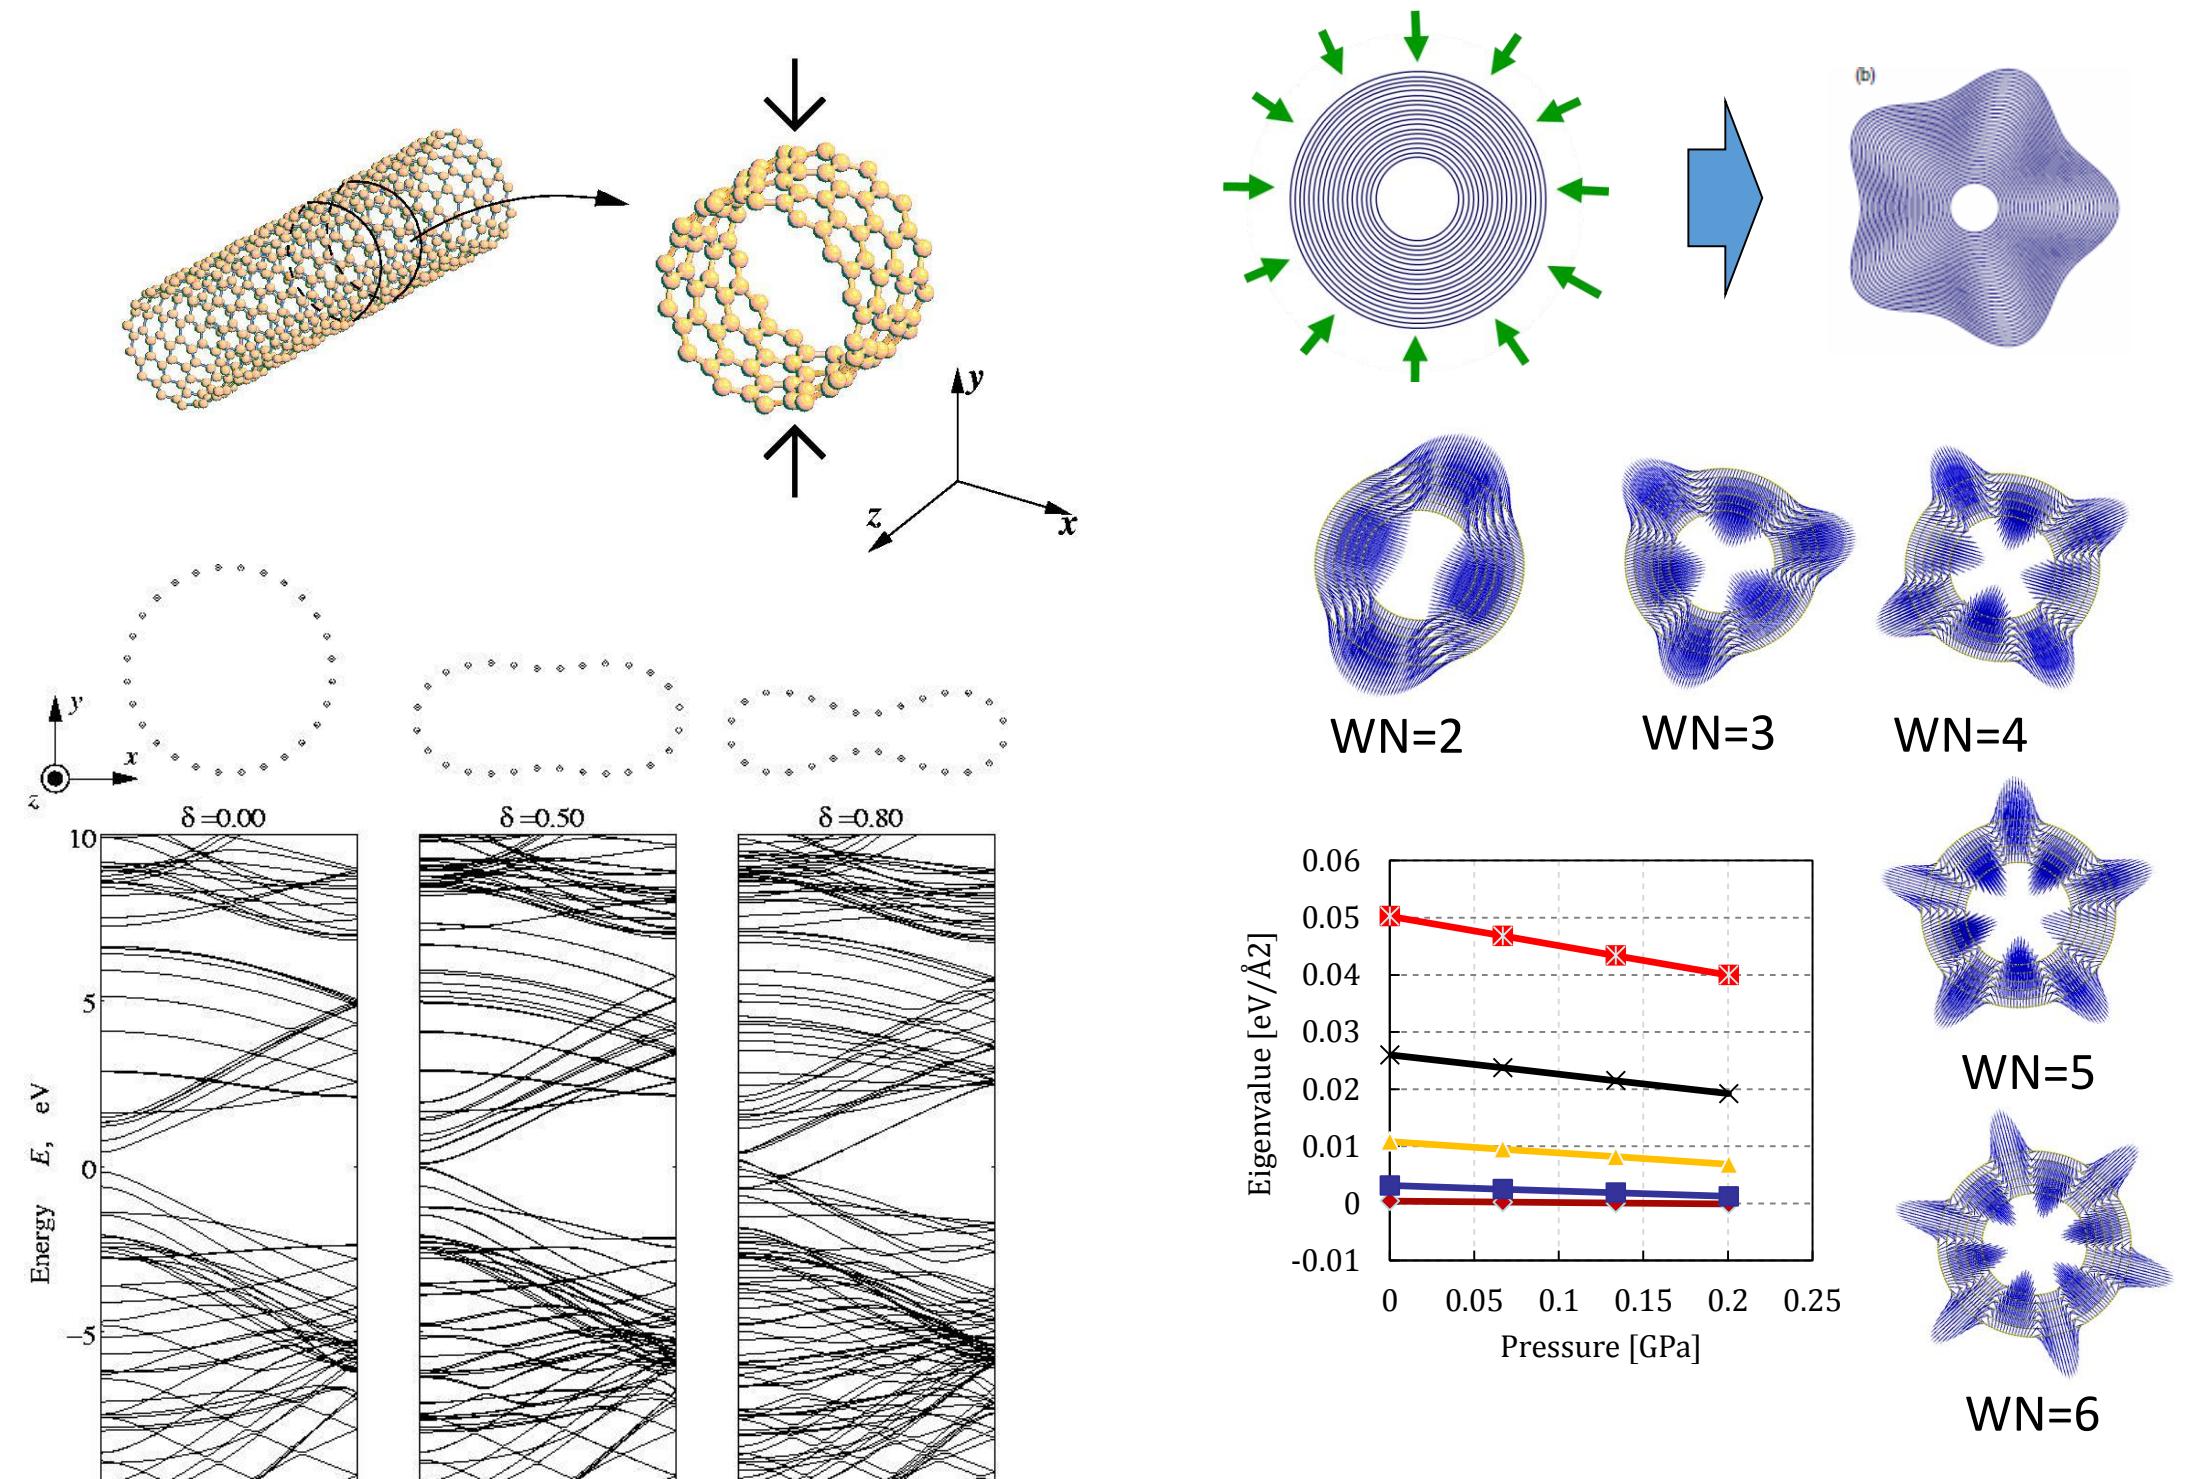

We aim to reveal the mechanical and physical properties of nanomaterials by ab initio density functional theory calculations and molecular dynamics simulations. We also work on multiscale simulation based on knowledge of nano-microscale phenomena.

Effect of normal stress on ideal shear strength

Ideal shear stress (ISS) under compression/tension, which is important to interpret experiments (e.g. nano-indentation tests), has been calculated. Response of ISS qualitatively differs. Note that compression always increases ISS in metals.

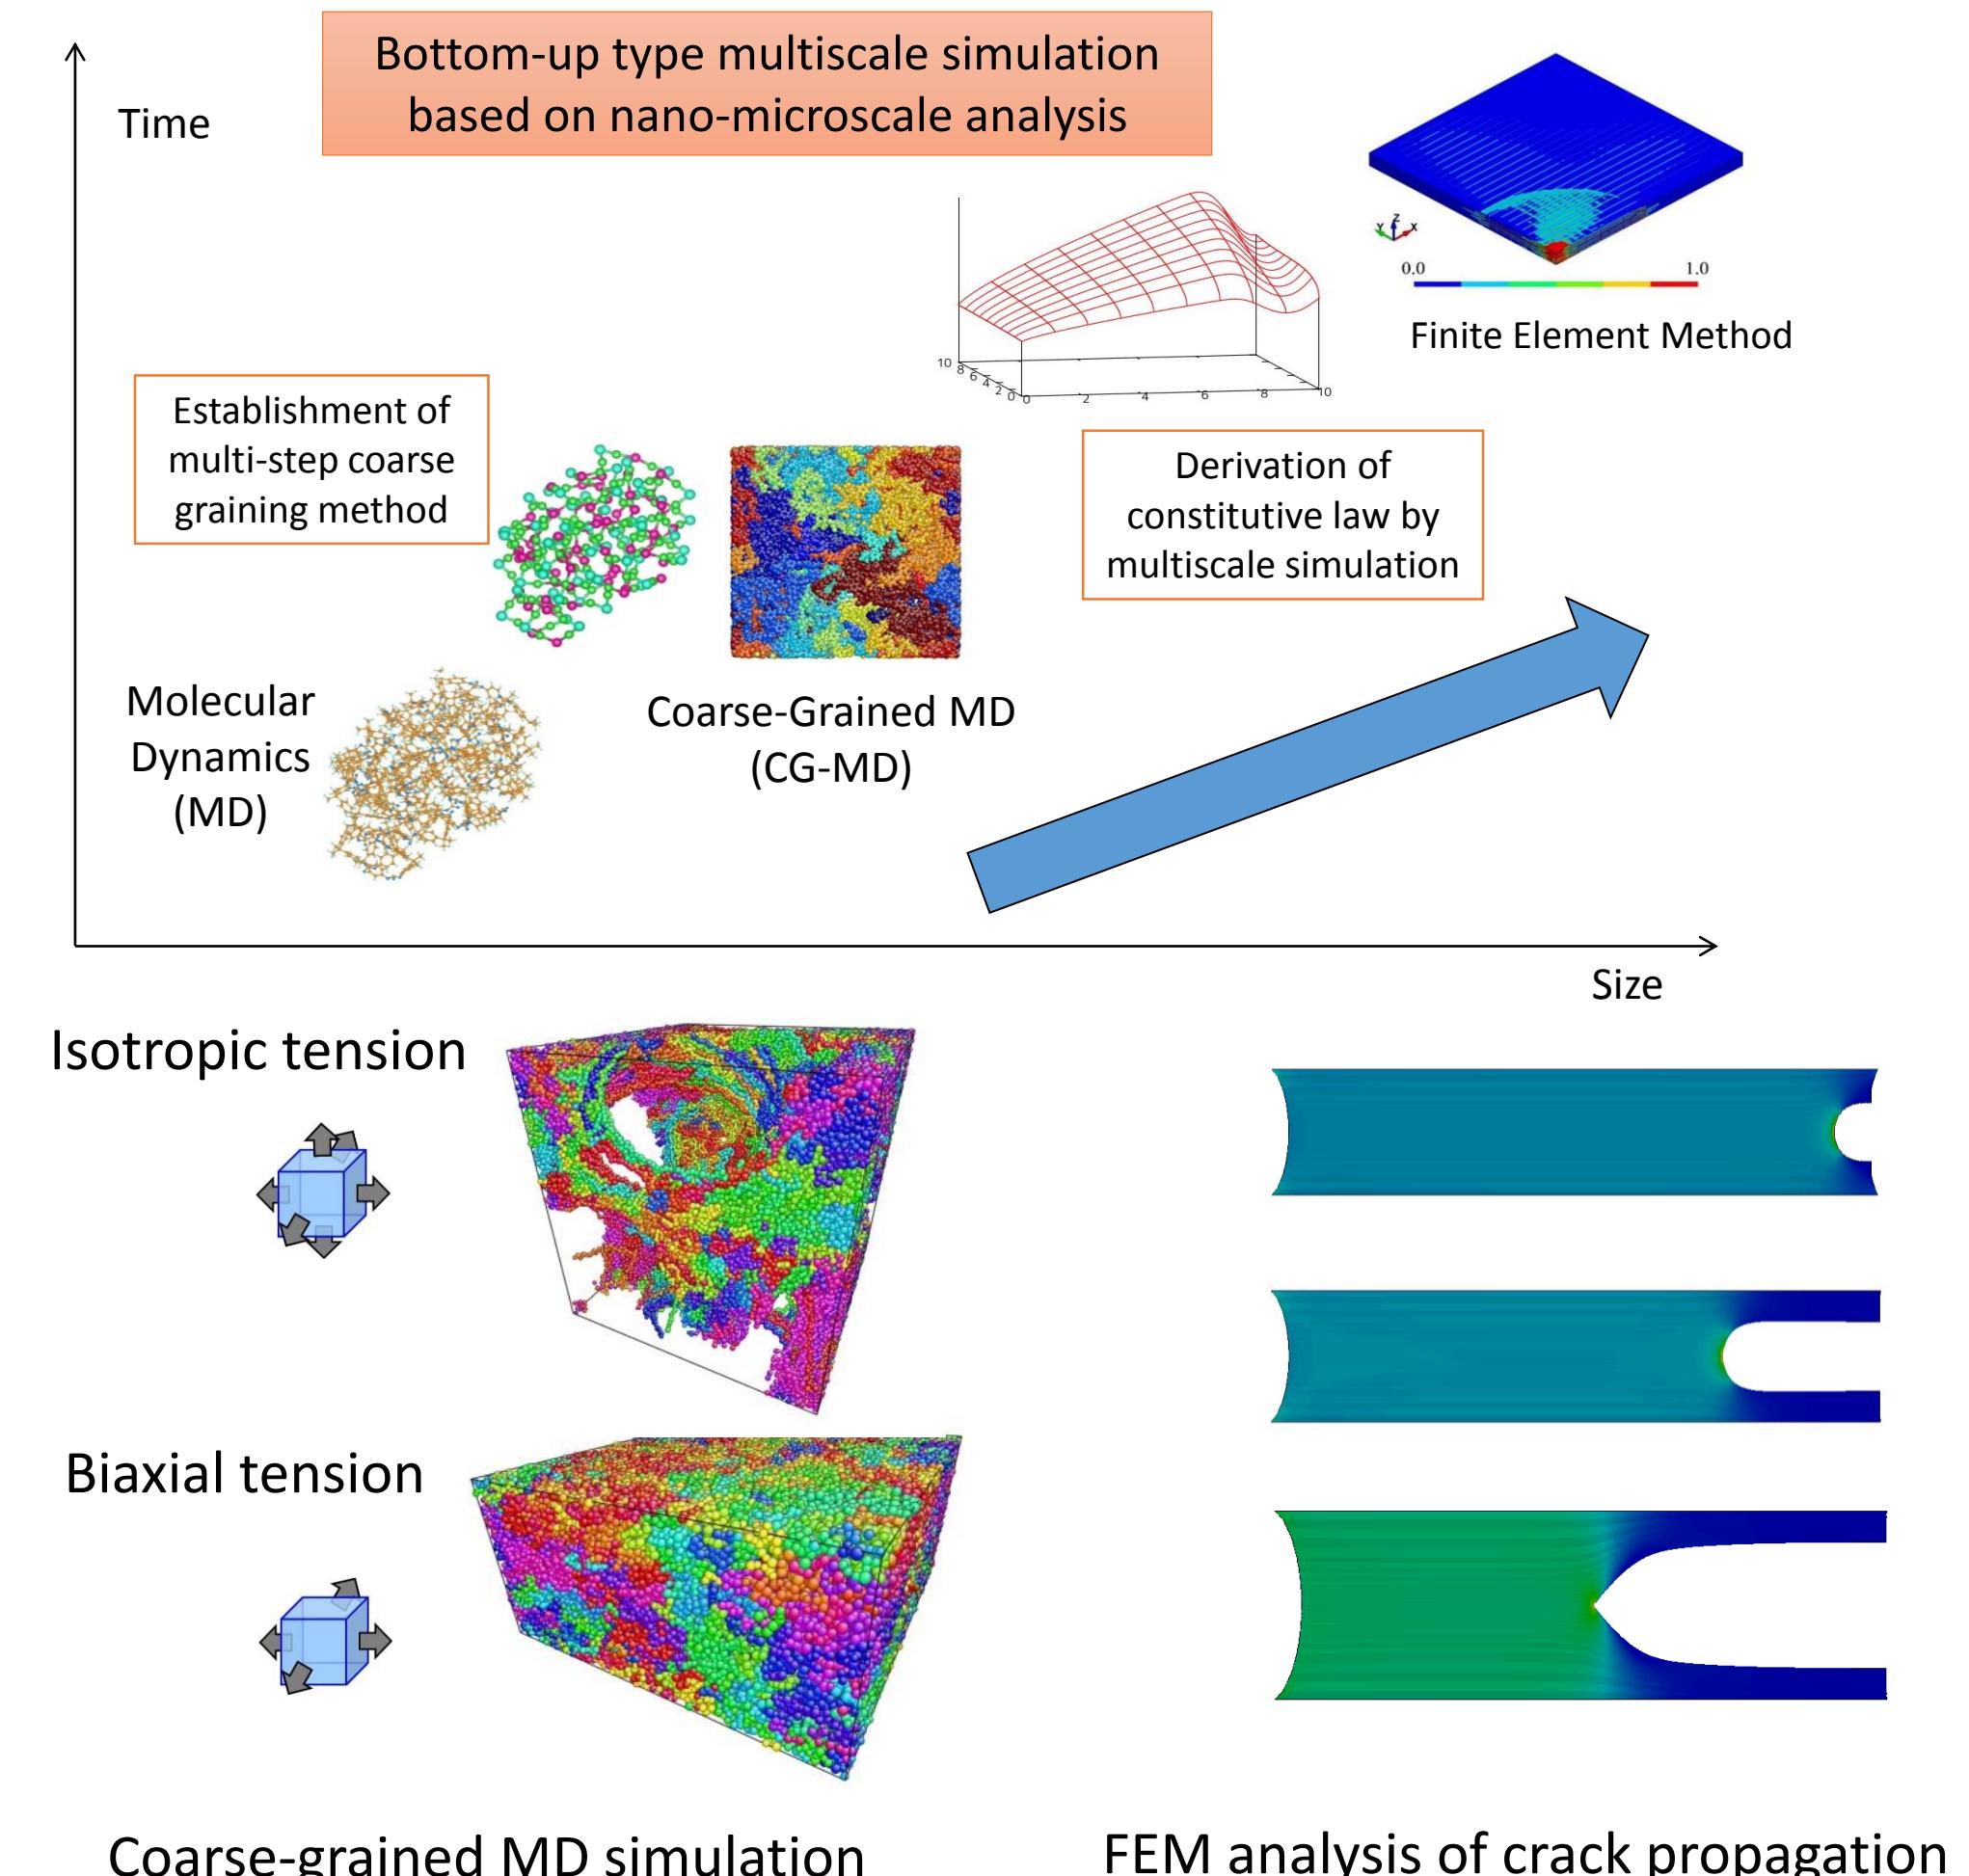

Compression of carbon nanotubes

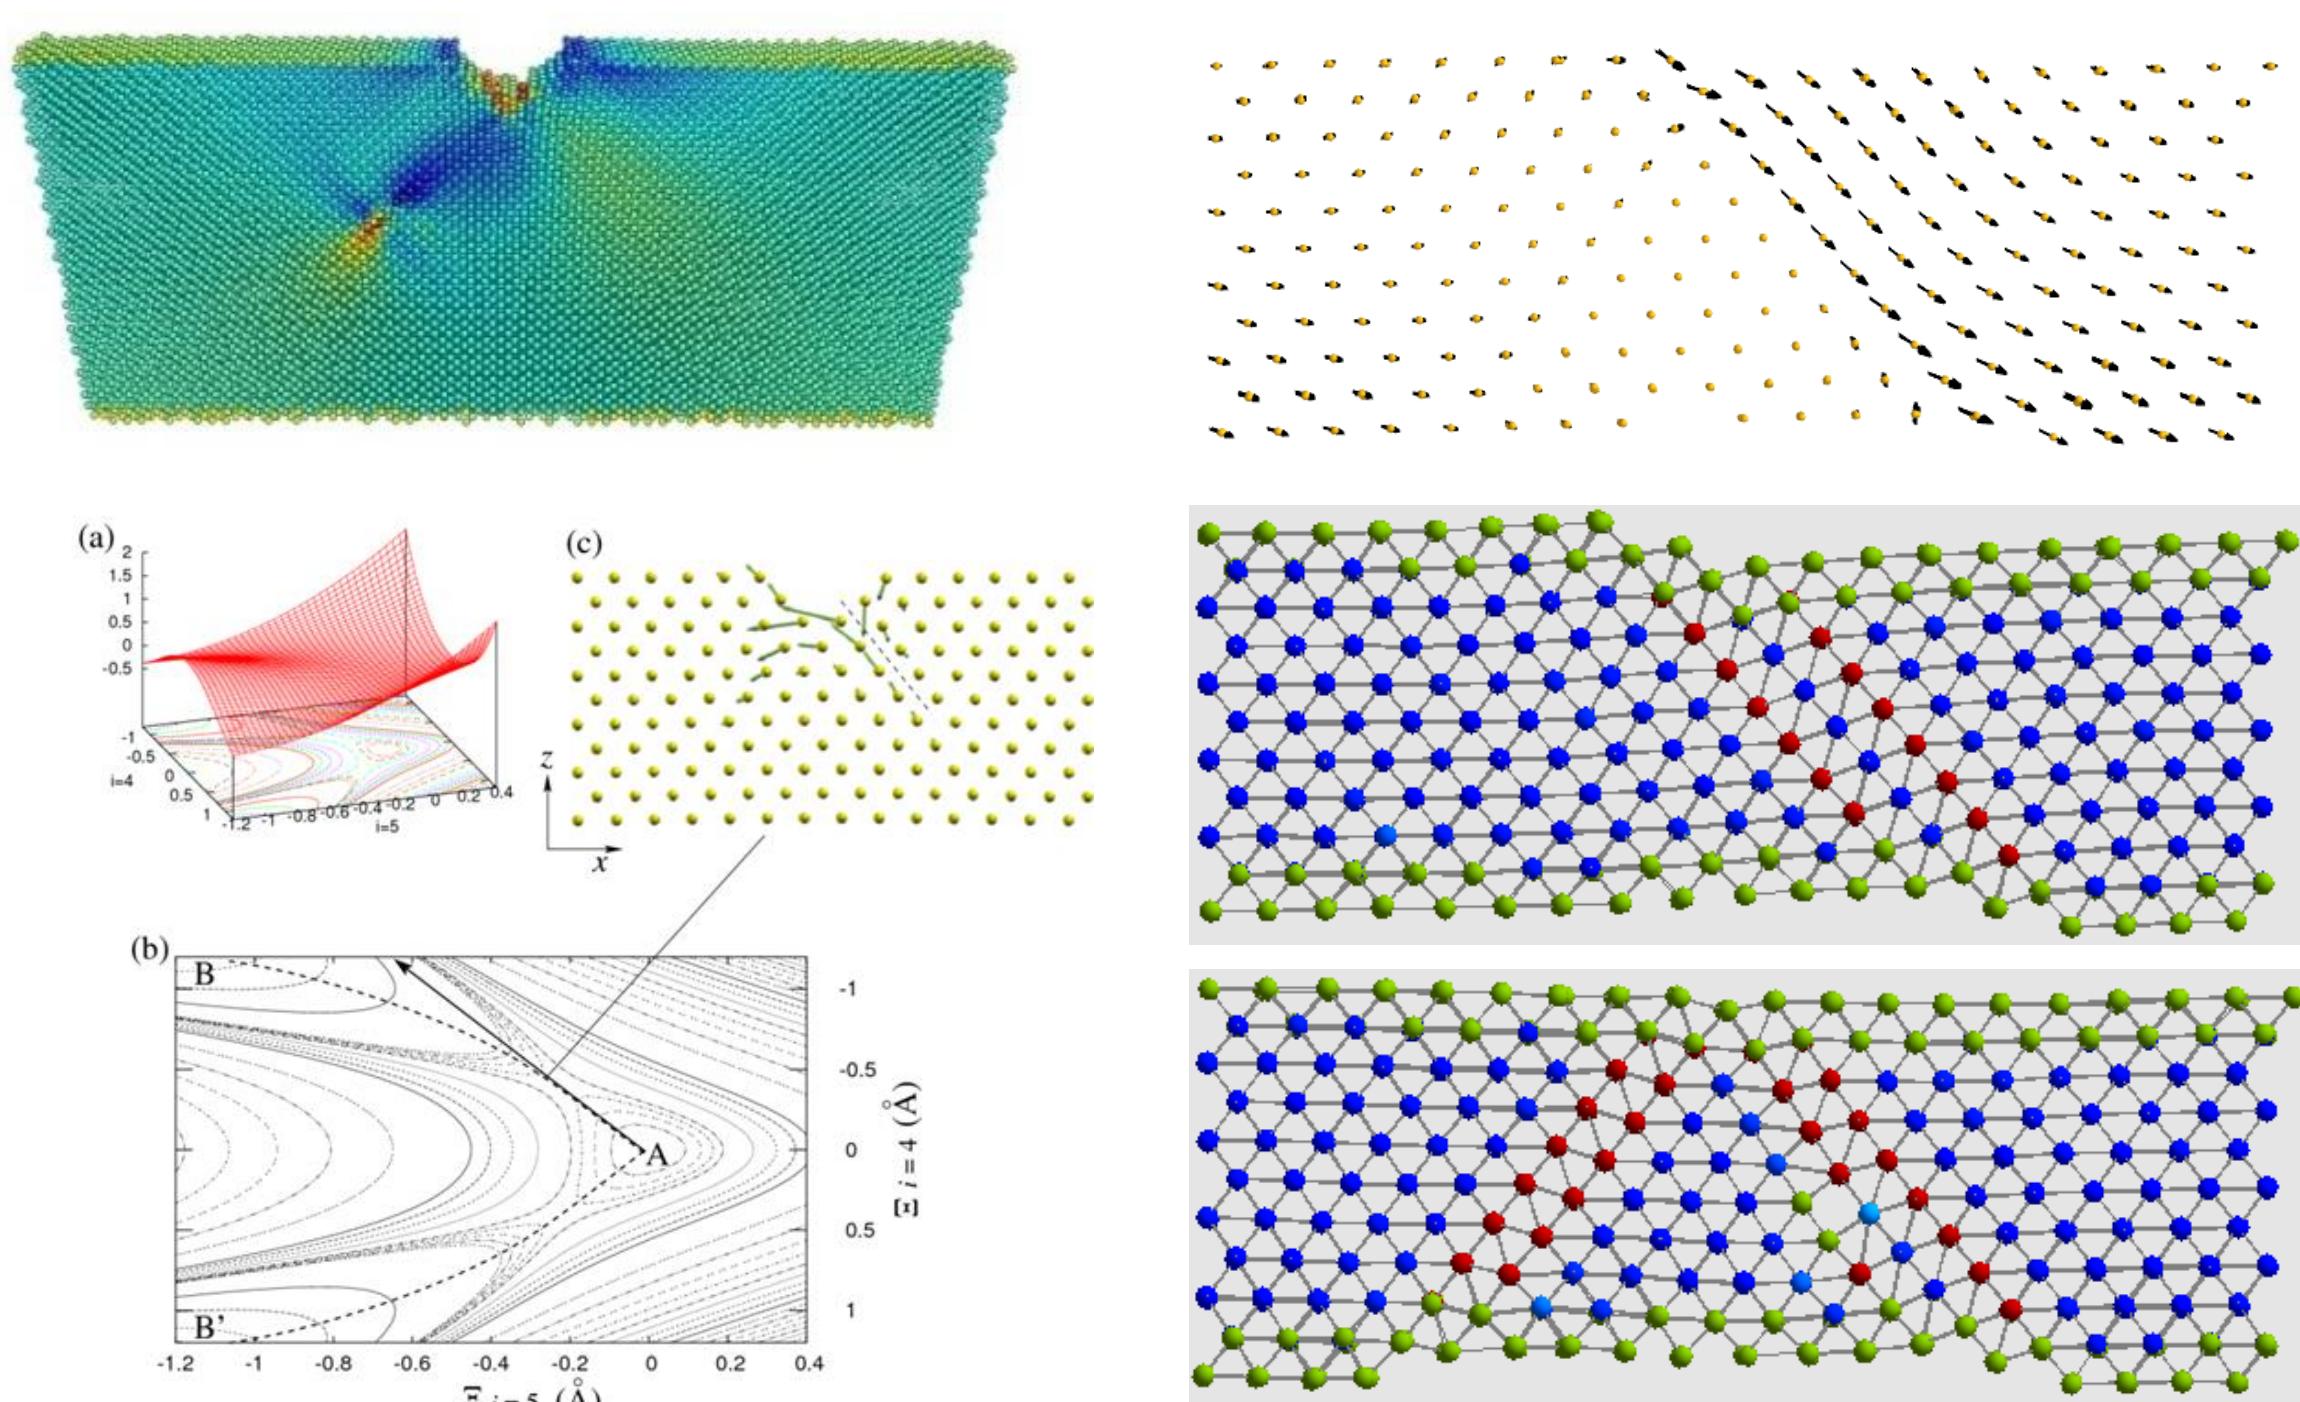

Analysis of band gap energy of carbon nanotubes under radial compression

Prediction of peculiar radial buckling under pressure (radial corrugation)

Multiscale simulation of polymer materials

Atomic structure instability analysis

Instability mode analysis of dislocation initiation from defect.
