#### (Research Area) Energy System Integration

Department of Electrical Engineering and Information Systems

Energy system, which is critical infrastructure to support social and economic activities, is currently facing new challenges to achieve security, economy and reduction of environmental burden including carbon emission for sustainability. Energy system of the new generation should require energy system integration involving newer forms supply, i.e. photovoltaic (PV), wind power and other renewables, as well as novel demand devices including electric vehicles and heat pump water heaters.

The upcoming energy system will require decentralized management for the integration of demand into demand-supply balancing in an energy system so as to accommodate renewable generation characterized by constantly fluctuating output and newer types of electrical loads. The decentralized energy management will assure flexibility in operation and system configuration as well as enhanced robustness against risk factors.

### **Energy System of the Next Generation**

Establishing long term view with firm technical and socio-economic basis

Long term view covering technological innovation, socioeconomic trend, and institution is crucial for studying energy issues. Our energy system integration research covers the following areas using technology assessment, simulation, optimization, scenario planning, strategic study and other techniques.

- Energy strategy
- Long term analysis and assessment of energy / material supply and demand
- Dynamic analysis and assessment of energy supply and demand

## **Decentralized Energy Management System**

Developing smart grid tightly integrated with overall energy system

The high penetration of fluctuating generation from PV and wind power could lead to supply-demand imbalance within a whole power system. Stabilization of the overall system will require and active interaction between the power system and residential energy management and batteries installed in the power system including demand side.

Our goal of the following research areas is not just energy management for demand or cost saving but contribution to overall system optimization while keeping utilities we enjoy through use of energy.

- Optimum operation scheduling for domestic appliances
- Distributed energy management simulation
- Asset management applied to decentralized energy system
