

Central Workshop

<http://www.iis.u-tokyo.ac.jp/~shisaku/>

The Central Workshop is involved in the design and fabrication of machines and instruments for experimental programs and supplies many useful materials for research activities.

It conducts metal, wood, and glass workshops; further, it operates like an open-use machine shop.

In recent years, it has conducted various technical instruction and training programs and has always obtained a high evaluation from the university.

The important equipment used by the Workshop include a wire electric discharge machine (WEDM), a machining center (MC) and a turning center.
