

13-9 The Vibrations of Polyatomic Molecules are Represented by Normal Coordinates.

A molecule consisting of N atoms has $3N$ degree of freedom $\left\{ \begin{array}{l} 3 \text{ translational} \\ 3 \text{ rotational (2 for linear molecule)} \\ 3N-6 \text{ vibrational (3N-5 for linear molecule)} \end{array} \right.$

$$\begin{aligned} V(q_1, q_2, \dots, q_{3N-6}) &= V(0, 0, \dots, 0) + \frac{1}{2} \sum_i \sum_j \left(\frac{\partial^2 V}{\partial q_i \partial q_j} \right) q_i q_j + \dots \\ &\Rightarrow \frac{1}{2} \sum_i \sum_j f_{ij} q_i q_j \\ &= \frac{1}{2} \sum_j F_j Q_j^2 \quad \{Q_j\} \text{ normal mode coordinate} \end{aligned}$$

$$\left. \begin{aligned} \hat{H}_{\text{vib}} &= -\sum_j \frac{\hbar^2}{2\mu} \frac{d^2}{dQ_j^2} + \frac{1}{2} \sum_j F_j Q_j^2 \\ &= \sum_j \left(-\frac{\hbar^2}{2\mu} \frac{d^2}{dQ_j^2} + \frac{1}{2} F_j Q_j^2 \right) \equiv \sum_j \hat{H}_{\text{vib},j} \\ \psi_{\text{vib}}(Q_1, Q_2, \dots, Q_{3N-6}) &= \psi_{\text{vib},1}(Q_1) \psi_{\text{vib},2}(Q_2) \dots \psi_{\text{vib},3N-6}(Q_{3N-6}) \end{aligned} \right\} \Rightarrow E = \sum_j h \nu_j \left(v_j + \frac{1}{2} \right)$$

Normal modes of H₂O

A₁ 3650 cm⁻¹

B₂ 3760 cm⁻¹

A₁ 1600 cm⁻¹

Selection rule: $\Delta v = +1$ } Dipole moment is parallel to bond axis.
 $\Delta J = \pm 1$ }

$\Delta v = +1$ } Dipole moment is perpendicular to bond axis.
 $\Delta J = 0, \pm 1$ }

Equation of motion for coupled oscillator

$$F_{ix} = m_i \frac{d^2}{dt^2} x_i$$

$$= \sum_j \frac{d^2 \phi}{dx_i dx_j} (x_j - x_i) \equiv \sum_j k_{ij} (x_j - x_i)$$

$$\left. \begin{aligned} K_{ij} &= -k_{ij} \\ K_{ii} &= \sum_j k_{ij} \end{aligned} \right\} \Rightarrow F_{ix} = -\sum_j K_{ij} x_j$$

$$x_i = x_{0i} \exp(-i\omega t)$$

$$\Rightarrow F_{ix} = -m_i \omega^2 x_i$$

$$\sum_j K_{ij} x_j = m_i \omega^2 x_i \Rightarrow Kx = Mx\omega^2$$

$$V = \frac{1}{2} x^t Kx = \frac{1}{2} x^t Mx\omega^2$$

ϕ : two-body potential

When a force proportional to displacement is taken into account, it is called harmonic approximation.

K: stiffness matrix

Oscillating x is assumed as a solution.

Simultaneous equations for all the particles.

→ An equation of matrix

V : Vibrational energy

Hessian method

$$M^{-1}Kx = x\omega^2$$

$$M = \begin{pmatrix} m_1 & & & & 0 \\ & m_1 & & & \\ & & m_1 & \dots & \\ & & & \dots & m_N \\ 0 & & & & m_N \\ & & & & & m_N \end{pmatrix}, K = \begin{pmatrix} \frac{\partial^2 U}{\partial \alpha_1^2} & \frac{\partial^2 U}{\partial \alpha_1 \partial y_1} & \frac{\partial^2 U}{\partial \alpha_1 \partial z_1} & & & & \\ \frac{\partial^2 U}{\partial y_1 \partial \alpha_1} & \frac{\partial^2 U}{\partial y_1^2} & \frac{\partial^2 U}{\partial y_1 \partial z_1} & \dots & & & \\ \frac{\partial^2 U}{\partial z_1 \partial \alpha_1} & \frac{\partial^2 U}{\partial z_1 \partial y_1} & \frac{\partial^2 U}{\partial z_1^2} & \dots & & & \\ & \vdots & \vdots & \ddots & & & \\ & & & & \frac{\partial^2 U}{\partial \alpha_N^2} & \frac{\partial^2 U}{\partial \alpha_N \partial y_N} & \frac{\partial^2 U}{\partial \alpha_N \partial z_N} \\ & & & & \frac{\partial^2 U}{\partial y_N \partial \alpha_N} & \frac{\partial^2 U}{\partial y_N^2} & \frac{\partial^2 U}{\partial y_N \partial z_N} \\ & & & & \frac{\partial^2 U}{\partial z_N \partial \alpha_N} & \frac{\partial^2 U}{\partial z_N \partial y_N} & \frac{\partial^2 U}{\partial z_N^2} \end{pmatrix}$$

$$M^{-1} = \begin{pmatrix} \mu_1 & & & & 0 \\ & \mu_1 & & & \\ & & \mu_1 & \dots & \\ & & & \dots & \mu_N \\ 0 & & & & \mu_N \\ & & & & & \mu_N \end{pmatrix}, x = \begin{pmatrix} x_1 \\ y_1 \\ z_1 \\ \vdots \\ x_N \\ y_N \\ z_N \end{pmatrix}$$

x is an eigenvector of M⁻¹K.
→ You have to find a set of x that diagonalizes M⁻¹K.

GF method

A variation of Hessian method, where the coordinate system is transformed so that the variables represents molecular parameters (such as bond length, bond angle, etc.).

$$\begin{cases} M^{-1}Kx = x\omega^2 \\ x' = U^t x \end{cases}$$

$$\Rightarrow U^t M^{-1} U U^t K U x' = U^t U x' \omega^2$$

$$\begin{cases} U^t M^{-1} U \equiv G \\ U^t K U \equiv F \end{cases}$$

$$\Rightarrow G F x' = x' \omega^2$$

U transforms the Cartesian coordinate into internal molecular coordinate.

F is a set of parameters such as stretching, biting, etc., intuitively understandable.

x' is an eigenvector of GF.

→ You have to find a set of x' that diagonalizes GF matrix.

Natural oscillation of a diatomic molecule

$$\begin{pmatrix} \mu_1 & 0 \\ 0 & \mu_2 \end{pmatrix} \begin{pmatrix} K & -K \\ -K & K \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} \omega^2$$

Hessian Method

$$\begin{pmatrix} \mu_1 K - \omega^2 & -\mu_1 K \\ -\mu_2 K & \mu_2 K - \omega^2 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = 0$$

when $\omega^2 = 0$

$$x_1 = \frac{1}{\sqrt{2}}, \quad x_2 = \frac{1}{\sqrt{2}}$$

when $\omega^2 = (\mu_1 + \mu_2)K$

$$x_1 = \frac{\mu_1}{\sqrt{\mu_1^2 + \mu_2^2}}, \quad x_2 = -\frac{\mu_2}{\sqrt{\mu_1^2 + \mu_2^2}}$$

GF method

$$x' = U^T x = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} x_1 + x_2 \\ x_1 - x_2 \end{pmatrix}$$

$$G = \frac{1}{2} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} \begin{pmatrix} \mu_1 & 0 \\ 0 & \mu_2 \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} = \frac{1}{2} \begin{pmatrix} \mu_1 + \mu_2 & \mu_1 - \mu_2 \\ \mu_1 - \mu_2 & \mu_1 + \mu_2 \end{pmatrix}$$

$$F = \frac{1}{2} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} \begin{pmatrix} K & -K \\ -K & K \end{pmatrix} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix} = \begin{pmatrix} 0 & 0 \\ 0 & 2K \end{pmatrix}$$

$$GF = \begin{pmatrix} 0 & (\mu_1 - \mu_2)K \\ 0 & (\mu_1 + \mu_2)K \end{pmatrix}$$

$$\begin{pmatrix} -\omega^2 & (\mu_1 - \mu_2)K \\ 0 & (\mu_1 + \mu_2)K - \omega^2 \end{pmatrix} \begin{pmatrix} x'_1 \\ x'_2 \end{pmatrix} = 0$$

Mass-weighted Hessian method

$$M^{-1}Kx = x\omega^2$$

$M^{-1}K$ is not a symmetric matrix.
 $\rightarrow x$'s are not diagonalized with each other.
 $\rightarrow \omega$ is not necessarily real.

$$M^{-1/2}KM^{-1/2}M^{1/2}x = M^{1/2}x\omega^2$$

$$M^{1/2} = \begin{pmatrix} \sqrt{m_1} & & & & 0 \\ & \sqrt{m_1} & & & \\ & & \sqrt{m_1} & & \\ & & & \ddots & \\ 0 & & & & \sqrt{m_N} \\ & & & & & \sqrt{m_N} \\ & & & & & & \sqrt{m_N} \end{pmatrix}$$

When we multiply $M^{1/2}$ on the both hands of the equation.

M is a diagonal matrix.
 $\rightarrow M^{1/2}$ is easily obtained.

$$\left. \begin{matrix} M^{-1/2}KM^{-1/2} \equiv D \\ M^{1/2}x \equiv w \end{matrix} \right\} \Rightarrow Dw = w\omega^2 \quad D_{ij} = \sqrt{\mu_i}\sqrt{\mu_j}K_{ij}$$

D is diagonal matrix.
 \rightarrow so-called dynamical matrix

Natural oscillation of a diatomic molecule

$$\begin{pmatrix} \mu_1 K & -\sqrt{\mu_1 \mu_2} K \\ -\sqrt{\mu_1 \mu_2} K & \mu_2 K \end{pmatrix} \begin{pmatrix} w_1 \\ w_2 \end{pmatrix} = \begin{pmatrix} w_1 \\ w_2 \end{pmatrix} \omega^2$$

$$\begin{pmatrix} \mu_1 K - \omega^2 & -\sqrt{\mu_1 \mu_2} K \\ -\sqrt{\mu_1 \mu_2} K & \mu_2 K - \omega^2 \end{pmatrix} \begin{pmatrix} w_1 \\ w_2 \end{pmatrix} = 0$$

when $\omega^2 = 0$

$$w_1 = \sqrt{\frac{\mu_2}{\mu_1 + \mu_2}}, \quad w_2 = \sqrt{\frac{\mu_1}{\mu_1 + \mu_2}}$$

when $\omega^2 = (\mu_1 + \mu_2)K$

$$w_1 = \sqrt{\frac{\mu_1}{\mu_1 + \mu_2}}, \quad w_2 = -\sqrt{\frac{\mu_2}{\mu_1 + \mu_2}}$$

Compared with GFmethod

$$GFx' = x'\omega^2$$

$$G^{1/2}FG^{1/2}G^{-1/2}x'$$

$$\left\{ G^{1/2}FG^{1/2} \equiv D' \right.$$

$$\left. G^{-1/2}x' \equiv w' \right.$$

$$\Rightarrow D'w' = w'\omega^2$$

$$\left\{ w' = G^{-1/2}x' \right.$$

$$= U^t M^{1/2} U U^t M^{-1/2} w = U^t w$$

$$\left. D' = G^{1/2}FG^{1/2} \right.$$

$$= U^t M^{-1/2} U U^t K U U^t M^{-1/2} U$$

$$= U^t D U$$

Orthonormalize GF matrix

→ D and D' are transformed to each other using U.

13-10 Normal Coordinates Belong to Irreducible Representation of Molecular Point Groups.

C_{2v}	E	C_2	$\sigma_v'(xz)$	$\sigma_v(yz)$
A_1	1	1	1	1
A_2	1	1	-1	-1
B_1	1	-1	1	-1
B_2	1	-1	-1	1

C_{2v}	E	C_2	$\sigma_v'(xz)$	$\sigma_v(yz)$
Γ_{3N}	9	-1	1	3

$$\Gamma_{3N} = 3A_1 + A_2 + 2B_1 + 3B_2$$

$$T_x, T_y, T_z \Rightarrow B_1, B_2, A_1$$

$$R_x, R_y, R_z \Rightarrow B_2, B_1, A_2$$

$$\text{振動} \Rightarrow A_1, A_1, B_2$$

13-11 Selection Rules are Derived from Time-dependent Perturbation Theory.

Time-dependent Schrödinger equation: $\hat{H}\Psi = i\hbar \frac{\partial\Psi}{\partial t}$, $\Psi_n(r,t) = \psi_n(r) \exp\left[-i \frac{E_n t}{\hbar}\right]$

Perturbation from electromagnetic field: $E = E_0 \cos 2\pi\nu t$

$$\hat{H}^{(1)} = -\mu \cdot E = -\mu \cdot E_0 \cos 2\pi\nu t$$

Two-state Model: $\Psi_1(t) = \psi_1 \exp\left[-i \frac{E_1 t}{\hbar}\right]$, $\Psi_2(t) = \psi_2 \exp\left[-i \frac{E_2 t}{\hbar}\right]$

By substituting $\Psi = a_1(t)\Psi_1 + a_2(t)\Psi_2$ into $\hat{H} + \hat{H}^{(1)}\Psi = i\hbar \frac{\partial\Psi}{\partial t}$, we obtain

$$\begin{aligned} \hat{H}^{(1)} \left(a_1 \exp\left[-i \frac{E_1 t}{\hbar}\right] \psi_1 + a_2 \exp\left[-i \frac{E_2 t}{\hbar}\right] \psi_2 \right) \\ = i\hbar \left(\frac{\partial a_1}{\partial t} \right) \exp\left[-i \frac{E_1 t}{\hbar}\right] \psi_1 + i\hbar \left(\frac{\partial a_2}{\partial t} \right) \exp\left[-i \frac{E_2 t}{\hbar}\right] \psi_2 \end{aligned}$$

13-11 Selection Rules are Derived from Time-dependent Perturbation Theory. (cont.)

Multiply ψ_2^* and integrate over the space. Then, assuming $a_1(0) = 1$, $a_2(0) = 0$, we obtain :

$$\begin{aligned} \frac{\partial a_2}{\partial t} &= -\frac{i}{\hbar} \exp\left[i\frac{(E_2 - E_1)}{\hbar}t\right] \int \psi_2^* \hat{H}^{(1)} \psi_1 d\tau \\ a_2(t) &= -\frac{i}{2\hbar} (\mu_z)_{12} E_{0z} \int_0^t \left\{ \exp\left[i\frac{(E_2 - E_1 + h\nu)t'}{\hbar}\right] + \exp\left[i\frac{(E_2 - E_1 - h\nu)t'}{\hbar}\right] \right\} dt' \\ &= \frac{1}{2} (\mu_z)_{12} E_{0z} \left\{ \frac{1 - \exp\left[-i\frac{(E_2 - E_1 - h\nu)t}{\hbar}\right]}{E_2 - E_1 - h\nu} \right\} \end{aligned}$$

Here, the transition dipole moment,

$$(\mu_z)_{12} = \int \psi_2^* \mu_z \psi_1 d\tau$$

was defined.

$$a_2^*(t)a_2(t) = \frac{(\mu_z)_{12}^2 E_{0z}^2 t^2}{4\hbar^2} \operatorname{sinc}^2\left(\frac{(E_2 - E_1 - h\nu)t}{2\hbar}\right)$$

13-12 The selection rule in the Rigid Rotator Approximation is $\Delta J = \pm 1$.

$$(\mu_z)_{J,M;J',M'} = \int \int Y_J^M(\theta, \phi) \hat{\mu}_z Y_{J'}^{M'}(\theta, \phi) \sin \theta \, d\theta d\phi$$
$$\hat{\mu}_z = \mu \cos \theta$$

$$\Rightarrow M' = M, J' = J + 1 \text{ or } J - 1$$

$$\Rightarrow \Delta M = 0, \Delta J = \pm 1$$

13-13 The Harmonic Oscillator Selection Rule is $\Delta v = \pm 1$.

$$(\mu_z)_{v,v'} = \int N_v N_{v'} H_v(\alpha^{1/2} q) e^{-\alpha q^2/2} \hat{\mu}_z H_{v'}(\alpha^{1/2} q) e^{-\alpha q^2/2} dq$$
$$\mu_z = eq$$

$$\Rightarrow v' = v + 1, v - 1$$

$$\Rightarrow \Delta v = \pm 1$$

13-14 Group Theory is Used to Determine the Infrared Activity of Normal Coordinate Vibrations Problems

$$I_{0 \rightarrow 1} = \int \psi_0(Q_1, Q_2, \dots, Q_{3N-6}) \hat{\mu}_z \psi_1(Q_1, Q_2, \dots, Q_{3N-6}) dQ_1 dQ_2 \dots dQ_{3N-6}$$

Ground state (totally symmetric) A_1 Excited state (Symmetry depends on normal mode) $\mu_x, \mu_y, \mu_z \Rightarrow B_1, B_2, A_1$
